Project Man. 412 Assignment 2

Emile Visser 21595240

Report submitted in partial fulfilment of the requirements of the module Project Management 412 for the degree Baccalaureus in Engineering at Stellenbosch University.

Executive Summary

We will design a high pressure vessel for industrial purposes

Project Scope

2.1. Introduction

2.2. Objectives

The objective of this project is to develop a high pressure vessel for industrial purposes (DETAIL) subject to time and monetary constraints specified by the customer while minimizing risk and maximizing stakeholder value. The product must be designed according to the the technical requirements specified by the multi-disciplinary team of engineers assigned to this project and approved by the customer.

The process for developing this product consists of evaluating the market to develop and execute a marketing plan based on these results. Using these results with the product specifications, the high-pressure vessel is designed, testing methods are derived and a risk analysis is conducted. The design's functionality is then tested by building a prototype that is subjected to the testing methods of the previous phase. These results are also used to determine if the prototype satisfies the design requirements.

If the prototype does not yield satisfactory results, the process is repeated until the requirements are met (given that the project's cost does not overrun). Once this step is reached, the manufacturing plan is developed and the product is advertised according to the marketing plan. Once sufficient materials are sourced, the manufacturing plan and the product is launched.

Throughout this process, as outlined in 2.7, the customer reviews the status of the product and gives their approval and/or feedback that must be taken into account.

2.3. Deliverables

2.4. Milestones

2.5. Work Breakdown Structure

2.6. Technical Requirements

This section describes the technical requirements determined by the multi-disciplinary team of engineers assigned to this project, subject to approval by the customer

2.6.1. Chemical Requirements

2.6.2. Civil Requirements

2.6.3. Electrical and Electronic Requirements

The high-pressure vessel must be monitored using a suite of analogue and digital sensors. This will be the purview of the electrical and electronic engineer.

This sensor suite must be designed and built using cost-effective and accurate components that can withstand the pressure inside the pressure vessel to be developed. Redundant sensors must also be included to provide reasonably accurate measurements in the event of a component failure or if the pressure vessel moves outside of its normal operating parameters.

All designs must follow industry best practice and safety standards.

2.6.4. Mechanical Requirements

2.6.5. Mechatronic Requirements

2.7. Customer Review and Approval Procedures

Project Baseline

The baseline for this project has been calculated using Microsoft Project and can be seen in A.1 and B.1.

Analysing this network leads to several potential problem areas. The first is that this project is sensitive to the hiring time of new resources. For example, if junior product designers are not hired by the time Phase 2 starts, the entire project will be delayed. To mitigate this potential problem, two engineers are hired that can cover a variety of specialities in the event that required resources are not obtained. The hiring strategy must also take this possibility into account, such as hiring resources a period earlier than they are required.

Budget

This chapter documents the budget that has been planned for this project. Resources that have not been hired as of Phase 1 have been assigned using generic resources and their cost has been calculated using average rates for their respective specialisation.

The cost breakdown of the project can be found in the Tab. 4.1 below:

Cost Type	Cost
Direct Resource Costs	30 9428,00
Training Costs	0
Managerial Action Costs	1 600,00
Overhead (20%)	61 885,60

 $Total: \quad 372 \ 913.6$

Table 4.1: Project Cost Breakdown

An overhead cost of 20% is added to account for unforeseen events and worker inefficiencies. This cost acts as a contingency fund to prevent cost overruns. Equipment and product material costs are not included in this budget.

Comparing this total cost with the project budget of 380 000 \$ yields a margin of 7 086.4 \$. This margin can be considered as a discretionary fund to be used for adjusting the hiring or managerial action strategy.

An overview of the cost status and distribution of the costs associated with the various tasks over the full project duration can be found in Fig. 4.1 below:

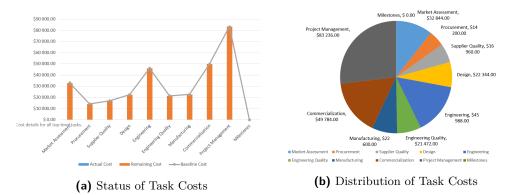

Figure 4.1: Status and Distribution of Task Costs

An overview of the cost status and distribution of the costs associated with the various resources over the full project duration can be found in Fig. 4.2 below:

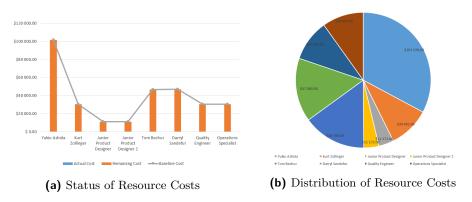

Figure 4.2: Status and Distribution of Resource Costs

The cost breakdown of the managerial actions planned for the project is found in Tab. 4.2 below:

Managerial Action	Action Amount	Action Unit Cost	Cost
Pizza Party	12	50,00	600
Management Recognition Award	4	250,00	1000

Total: 1 600,00

Table 4.2: Managerial Actions Cost Breakdown

The managerial actions planned to be taken consist of a pizza party for all employees at every period as well as management recognition awards at regular intervals throughout the project.

It was decided that training resources was not worth the cost and lost hours for the relatively small gains in efficiency.

A detailed budget with task assignments, baseline budget and baseline duration can be found in A.1.

Chapter 5 Risk Analysis

Bibliography

Appendix A

Detailed Budget

The detailed budget can be found on the following pages. Note that the image can be zoomed in to read details of the various tasks.

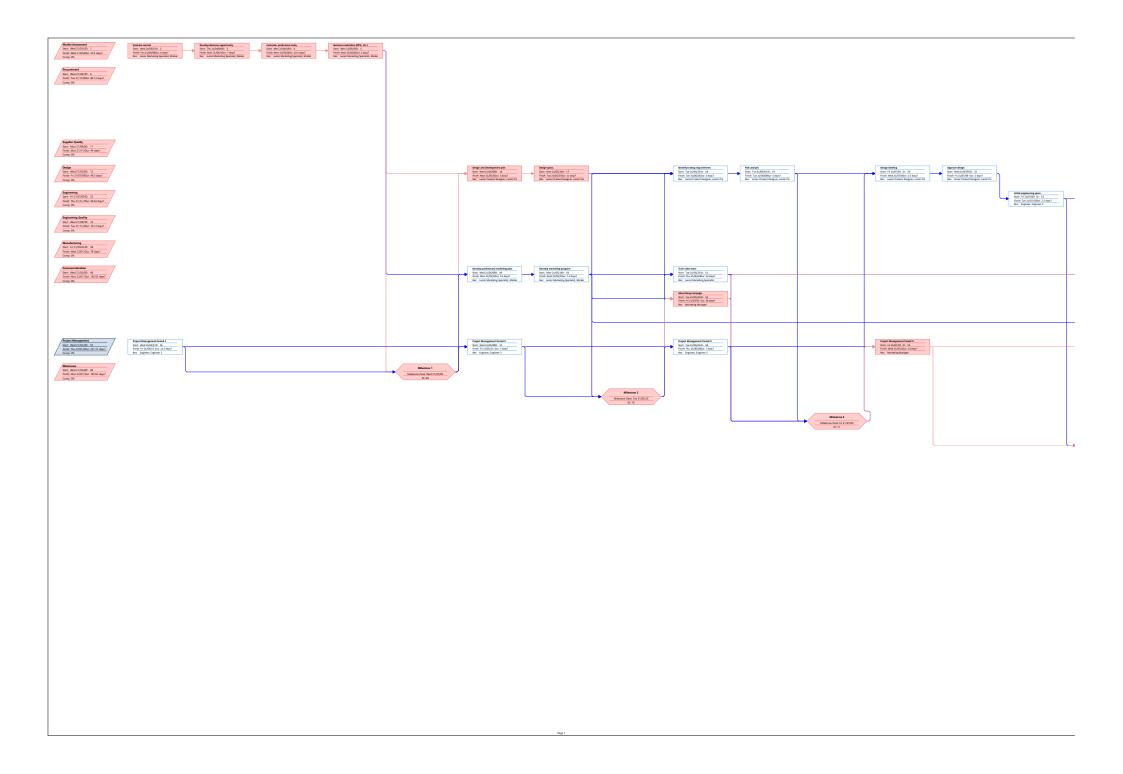

ID	Task Name	Resource Names	Baseline Cost	Baseline Estimated Duration	
1	Market Assessment		\$32 844.00	25.5 days	
2	Evaluate market	Kurt Zollinger, Yukio Ashida	\$7 728.00	6 days	
3	Develop Business opportunity	Kurt Zollinger, Yukio Ashida	\$9 016.00	7 days	
4	Customer preference study	Kurt Zollinger, Yukio Ashida	\$13 524.00	10.5 days	
5	Business evaluation (NPV, etc.)	Kurt Zollinger, Yukio Ashida	\$2 576.00	2 days	
6	Procurement		\$15 552.00	84.13 days	
7	Identify vendors	Kurt Zollinger	\$3 528.00	7 days	
8	Develop and Issue RFQ	Kurt Zollinger	\$3 024.00	6 days	
9	Issue sample (production equivalent)	Quality Engineer	\$3 000.00	5 days	
10	Assess RFQ responses and select vendors	Quality Engineer	\$6 000.00	10 days	
11	Supplier Quality		\$15 952.00	45 days	
12	Perform supplier process capability	Operations Specialist	\$5 600.00	14 days	
13	Approve sample parts	Tom Becher	\$4 352.00	8 days	
14	Qualify Supplier	Quality Engineer	\$6 000.00	10 days	
15	Design		\$22 344.00	46.5 days

E-design 344 Social Contract

2020

The purpose of this document is to establish commitment between the student and the organisers of E344. Beyond the commitment made here, it is not binding.

In the months preceeding the term, the lecturer (Thinus Booysen) and the Teaching Assistant (Michael Ritchie) spent countless hours to prepare for E344 to ensure that you get your money's worth and that you are enabled to learn from the module and demonstrate and be assessed on your skills. We commit to prepare for the module, to set the tests and assessments fairly, to be reasonably available, and to provide feedback and support as best and fast we can. We will work hard to give you the best opportunity to learn from and pass analogue electronic design E344.
